# Mechanical Construction

Our reputation for timely execution of construction projects while maintaining the highest safety standards has distinguished Fluidics as one of the most sought-after contractors in the region.

The modern-day Fluidics is a far cry from the upstart mechanical construction company founded in Philadelphia in 1968. Through diversification and prudent risk-taking, our company now provides many diverse services to the engineering and construction community as well as to private building owners and managers.

The team of design professionals, engineers, cost estimators, and project managers that comprise our Construction Division continues to leave its mark on the regional landscape projects. Some notable projects include: Urban Outfitters Corporate Offices, The Philadelphia Customs House, Saint Joseph's University Expansion, and Thomas Jefferson University's Plant Modernization.

### State of the art technology to better serve you

Our specialists use state-of-the-art tools, like "Quick-Pen", and the latest CAD technologies to fully support our estimators, project managers, foreman, and field staff. Sophisticated project management software, networked to optimize swift and accurate communications, ensures that the quality and budgetary integrity of our work is maintained.

### Safety is never sacrificed

Large projects involving HVAC, plumbing, as well as specialty piping and welding are routinely executed on time and within budget, working for general contractors and construction managers or for the owner directly. Pre-fabrication of piping on large projects in our environmentally controlled shop adds efficiency and quality. These services and materials are provided with no compromise on safety.
